1	Brian Handspicker	<p>This is Brian Handspicker. Stewards of Change Institute. Can you hear me? Okay. Great.</p> <p>I'd like to point out that focusing on whether a repository of data storage is central or not is, I think, is a challenging problem, because even if you are able to assert within the bounds of a certain group of organizations that everything shall be centralized into this one repository there are always going to be organizations that come along that either aren't part of the group in your state or are associated with somebody who's moved in from another State, or are associated with an application that isn't registered with that central repository. So, there are always going to be consents and other kinds of data that are scattered all over the place. It's better to take a federated approach in general and say, okay, now, how do we solve the problem of centralized access to distributed information? And that's where the San Diego leap CDS implementation kind of but rises to the top here, because they had built into it a consent discovery service, whose sole job it was to keep track of where in that local community were various consents stored, really, where our various sensitive records likely to be stored, and therefore consents associated with those records storing, and you go to one place, you solve the problem.</p>
2	Lucy Johns	<p>I'm not going to comment on the options. I just want to compliment Rim and the staff for capturing so much complexity in just 3 or 4 questions, with 3 or 4 options under each one. This has been a really valuable discussion. I think it will be a miracle if it comes to closure. But it certainly is a case study in how to talk</p>

		about really complicated problems. So as a member of the public, I want to thank you.
<b>3</b>	Carol Robinson	Hi, thanks for taking my question. I am curious. I haven't heard the group discuss resolution of conflicting consent information when perhaps, you know, a person has given consent multiple times, and those are stored in various registries or repositories of consent documents. What's the source of truth? How do you resolve those questions around conflicting data, sharing instructions.
